

Fdata FBS Document Builder Released

VANCOUVER, B.C. – April, 2007 - FData Management Software Inc. today announced the public release of the Document Builder Module for FBS.

Fdata is pleased to announce the release of its first Document Builder module. Under development for over 6-months, the Document Builder fits a need every one of Fdata's customers has identified. Fdata will begin rolling out the Document Builder to its clients immediately.

Having standardized documentation is a must in any business. If you require a constant look and feel across all parts of your organization, standardized legal terms or just a simple form letter, you need to take control of how your documents are built.

FData has built onto its Foundation Business Suite (FBS) to include the Document Builder module. This user friendly tool gives a business full control over the content of all its corporate communications. End users get to use Microsoft Office tools they already know to build the standardized sections, use real-time data to populate fields and have complete control over the final output.

We encourage you to speak to a Fdata Business Analyst about how the Document Builder can help solve your document creation, security and management challenges

About FData Management Software Inc.

Fdata Management Software Inc. sells Fdata Framework a "Model Driven Architecture" platform allowing businesses to rapidly build data management applications, and FBS – Fdata Business Suite, the ERP, BI and Business Management software suite developed with Framework.
